Using Machine Translation Techniques for Paraphrasing

Chris Callison-Burch

April 10, 2014

with Benjamin Van Durme, Juri Ganitkevitch, Ellie Pavlick, Wei Xu, Courtney Napoles, Xuchen Yao, Peter Clark, Jonny Weese, Matt Post, Tsz Ping Chan, Rui Wang, Trevor Cohn, Mirella Lapata and Colin Bannard

Paraphrases

Differing **textual** expressions of the same **meaning**:

cup	↔	mug
the king's speech	↔	His Majesty's address
X	↔	X
one JJ instance of NP	↔	a JJ case of NP

Paraphrasing in NLP

Recognition or generation of paraphrases plays a part in...

...information extraction, question answering, entailment recognition, summarization, translation, compression, simplification, natural language generation, etc.

Data-Driven Paraphrasing

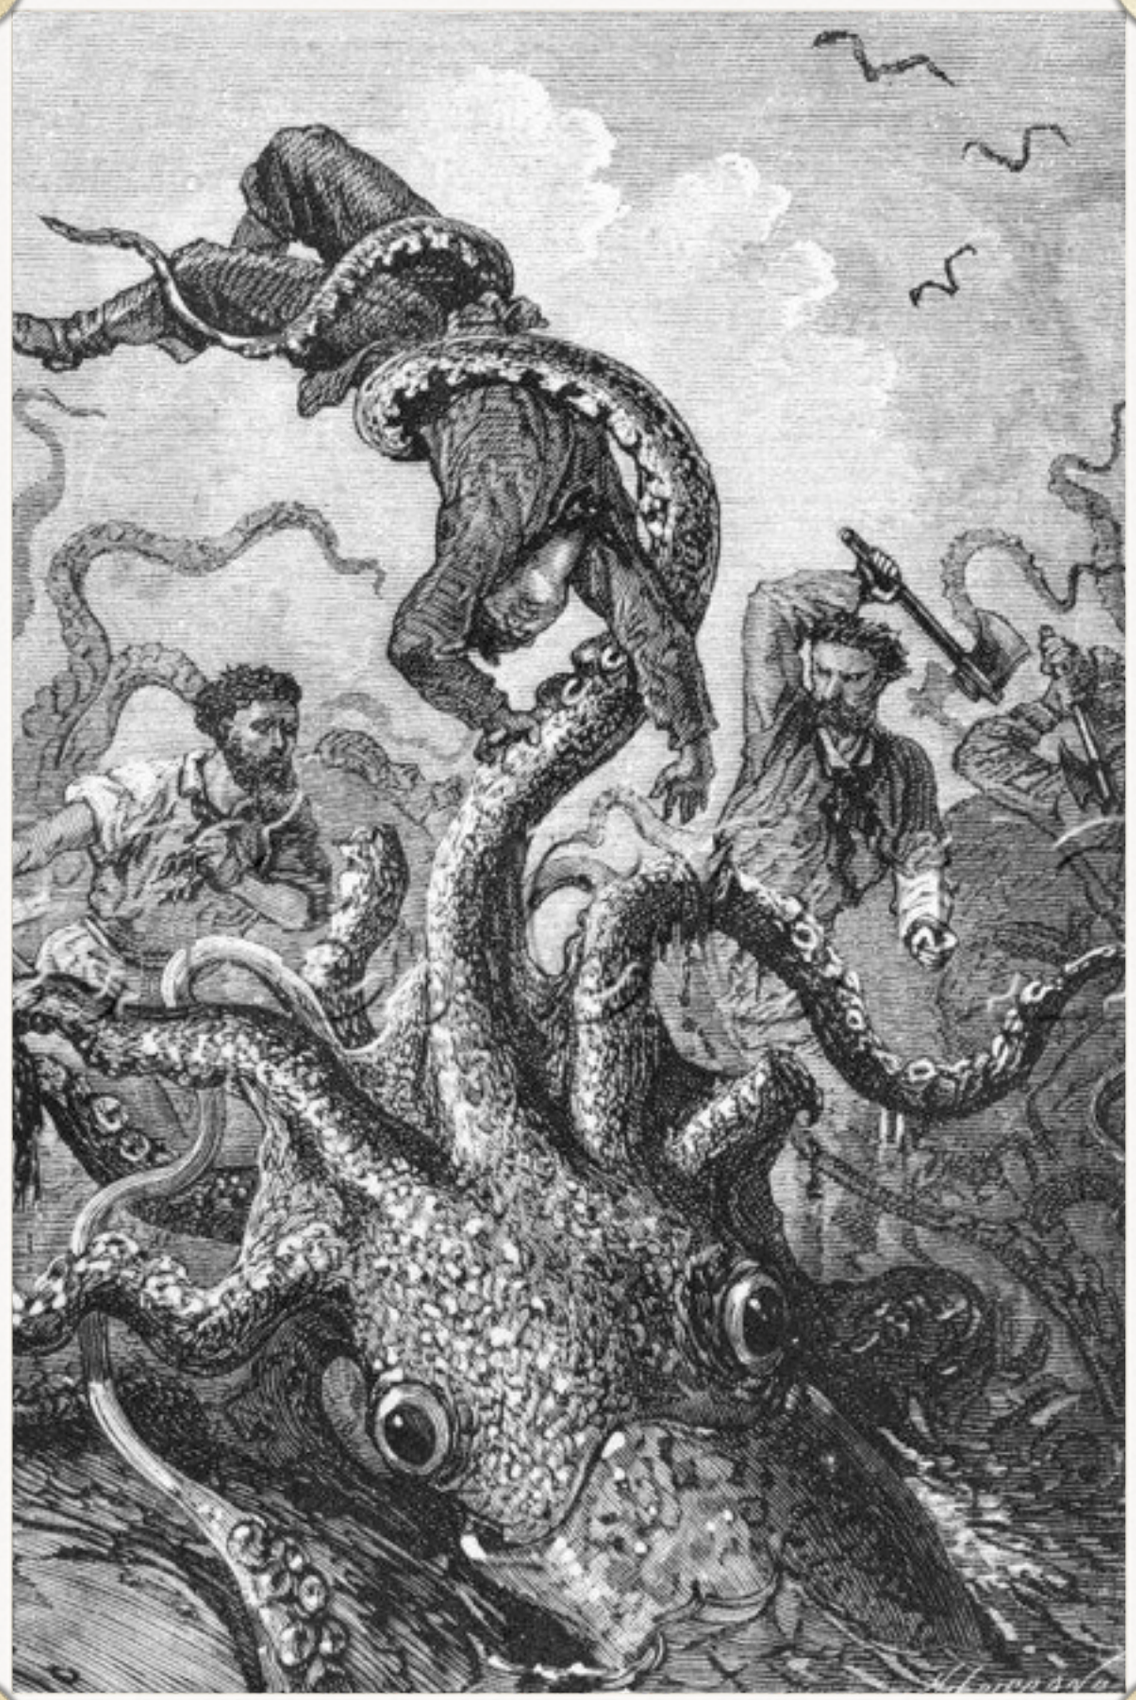
Monolingual parallel: English – English

Monolingual comparable: English ~ English

Plain monolingual: English

Bilingual parallel: English – French

Generating Phrasal and Sentential Paraphrases: A Survey of Data-Driven Methods.
Nitin Madnani and Bonnie Dorr. 2010. Computational Linguistics, 36(3), pages 341-387.



What a scene! Seized by the tentacle and **glued to** its suckers, the unfortunate man was **swinging in the air** at the **mercy** of this enormous appendage. He gasped, he choked, he yelled: "Help! Help!" I'll hear his **harrowing plea** the rest of my life!
The **poor fellow** was **done for**.

What a scene! The unhappy man, seized by the tentacle and **fixed to** its suckers, was **balanced in the air** at the **caprice** of this enormous trunk. He rattled in his throat, he was stifled, he cried, "Help! help!" That **heart-rending cry**! I shall hear it all my life.
The **unfortunate man** was **lost**.

Paraphrasing with parallel monolingual data

Barzilay and McKeown (2001) identify paraphrases using identical contexts in aligned sentences:

Emma burst into tears **and he tried to** comfort **her,** saying things to make her smile.
Emma cried **and he tried to** console **her,** adorning his words with puns.

burst into tears = cried and comfort = console

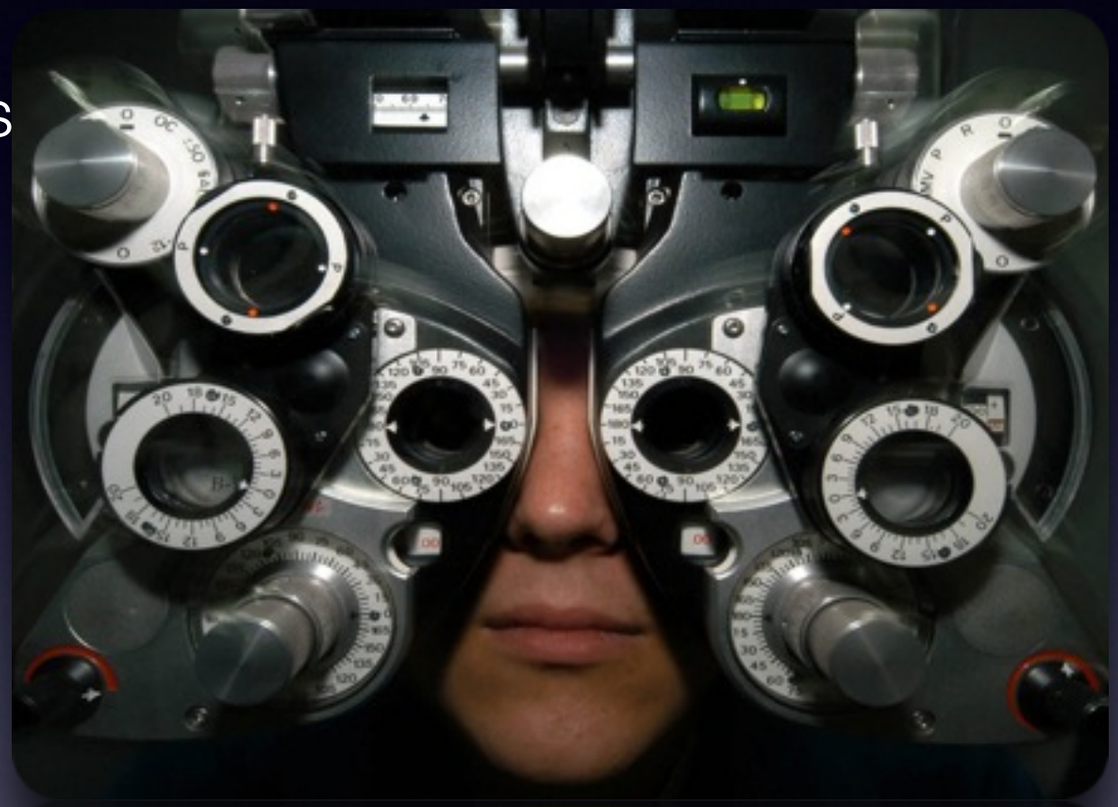
Paraphrasing with comparable texts

Dolan, Quirk, and Brockett (2004) extract sentential paraphrases from newspaper articles published on the same topic and date:

On its way to an extended mission at Saturn, the Cassini **probe** on Friday makes its closest **rendezvous** with Saturn's **dark** moon Phoebe.
The Cassini **spacecraft**, which is **en route** to Saturn, is about to make a **close pass** of the ringed planet's **mysterious** moon Phoebe.

Distributional Hypothesis

If we consider **oculist** and **eye-doctor** we find that, as our corpus of utterances grows, these two occur in almost the same environments. In contrast, there are many sentence environments in which **oculist** occurs but **lawyer** does not...



It is a question of the relative frequency of such environments, and of what we will obtain if we ask an informant to substitute any word he wishes for **oculist** (not asking what words have the same meaning).

These and similar tests all measure the probability of particular environments occurring with particular elements... If A and B have almost identical environments we say that they are synonyms.

–Zellig Harris (1954)

DIRT

Lin and Panel (2001) operationalize the Distributional Hypothesis using **dependency relationships** to define **similar environments.**

Duty and **responsibility** share a similar set of dependency contexts in large volumes of text:

modified by adjectives	objects of verbs
additional, administrative, assigned, assumed, collective, congressional, constitutional ...	assert, assign, assume, attend to, avoid, become, breach ...

My focus:
Paraphrasing & Translation

Translation is re-writing a text using words in a different language.

Paraphrasing is translation into the same language.

Inspiration from Statistical Machine Translation

We reuse & adapt:

Syntactic constraints

thrown into jail

arrested	be thrown in prison	~~arrest~~
detained	been thrown into jail	~~cases~~
imprisoned	being arrested	~~custody~~
incarcerated	~~in jail~~	maltreated
jailed	~~in prison~~	~~owners~~
locked up	~~put in prison for~~	~~protection~~
taken into custody	were thrown into jail	~~thrown~~
thrown into prison	~~who are held in detention~~	

Syntactic Constraints on Paraphrases Extracted from Parallel Corpora. Chris Callison-Burch. EMNLP 2008.

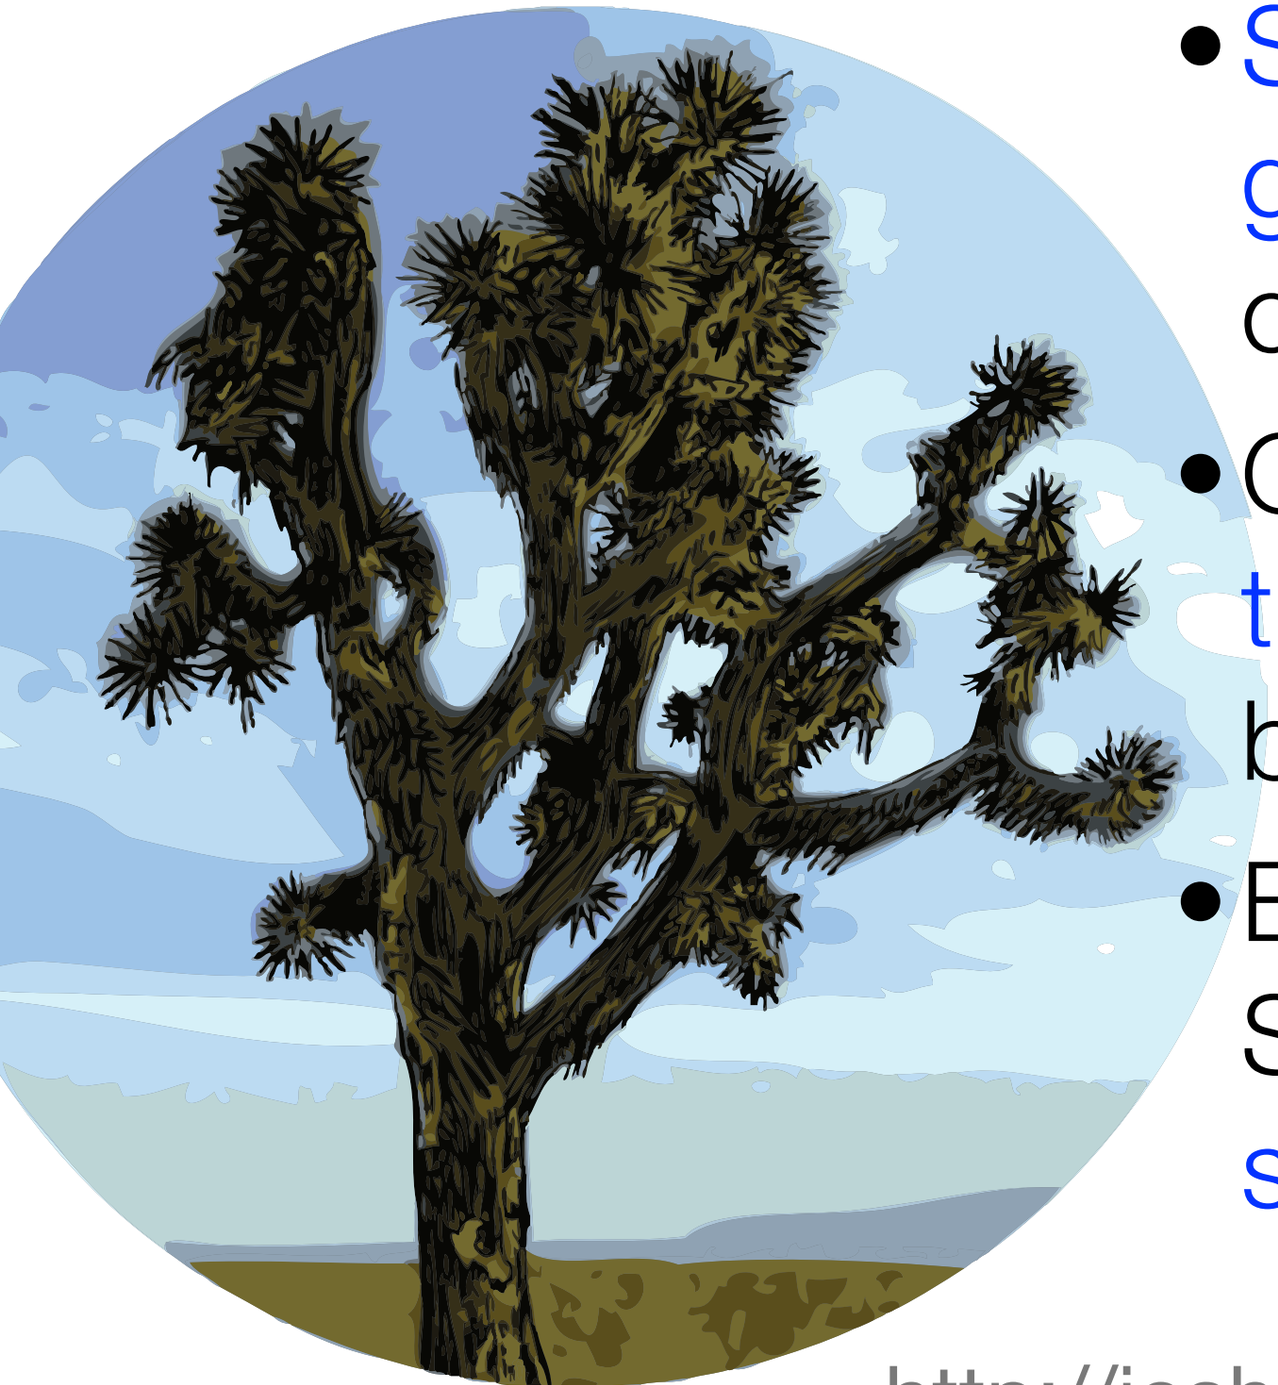
Sentential paraphrases from bitexts?

Bilingual parallel corpora provide an excellent source of **lexical** and **phrasal** paraphrases.

Sentential | structural paraphrases are more obviously learned from **English-English sentence pairs.**

Can we learn structural paraphrases from bitexts?
How should we represent them?

Syntactic MT in the Joshua Decoder



- Synchronous context free grammars generate pairs of corresponding strings
- Can be used to describe translation and re-ordering between languages
- Because Joshua uses SCFGs, it translates sentences by parsing them

Example SCFG for translation

	Urdu	English

SCFGs via Pivoting

- Adapting our syntactic MT models, we learn structural transformations, like the English possessive rule

NP → NP 's NN | le NN de NP

NP → the NN of NP | le NN de NP

combine to

NP → NP 's NN | the NN of NP

Possessive rule	NP →	the NN of the NNP	|	the NNP's NN
	NP →	the NNS	|	the NNS
Dative shift	VP →	give NN to NP	|	give NP the NN
	VP →	provide NP	|	give NP
Adv. | adj. phrase move	S | VP →	ADVP they VBD	|	they VBD ADVP
	S →	it is ADJP VP	|	VP is ADJP
Verb particle shift	VP →	VB NP up	|	VB up NP
Reduced relative clause	SBAR | S	although PRP VBD that	|	although PRP VBD
	ADJP →	very JJ that S	|	JJ S
Partitive constructions	NP →	CD of the NN	|	CD NN
	NP →	all DT\NP	|	all of the DT\NP
Topicalization	S →	NP, VP.	|	VP, NP.
Passivization	SBAR →	that NP had VBN	|	which was VBN by NP
Light verbs	VP →	take action ADVP	|	to act ADVP
	VP →	to make a decision PP	|	to decide PP

Learning Sentential Paraphrases from Bilingual Parallel Corpora for Text-to-Text Generation.
Juri Ganitkevitch, Chris Callison-Burch, Courtney Napoles, and Benjamin Van Durme. EMNLP 2011.

Text-to-Text Generation

T2T involves generating **meaning-equivalent text** that is *subject to some constraints*:

sentence compression, *shorter*

simplification, *easier to understand*

poetry from prose, *rhyme and meter*

Sentence Compression

Reduce length of a sentence (#chars) while retaining the meaning

Compression ratio: $\varphi = \frac{length_{compression}}{length_{original}}$

Paraphrasing as a task and problem is of paramount importance to a multitude of applications in the field of NLP.

Sentence Compression

Reduce length of a sentence (#chars) while retaining the meaning

Compression ratio: $\varphi = \frac{length_{compression}}{length_{original}}$

Paraphrasing ~~as a task and problem is of paramount importance to a multitude of applications in the field of NLP~~ is awesome.

Paraphrase Grammar

	English	English

Text-to-Text Applications

Claim:

> Paraphrasing is suitable to tackle sentential text-to-text tasks, and we can re-use SMT machinery for T2T.

However:

> **Naive** application of MT techniques will not work, need to **adapt them**

Task Adaptation

SMT	T2T
Naive application of the MT machinery to the task	Task-specific adaptations

- Development data
- Objective function
- Feature set
- Grammar augmentations

Development Data

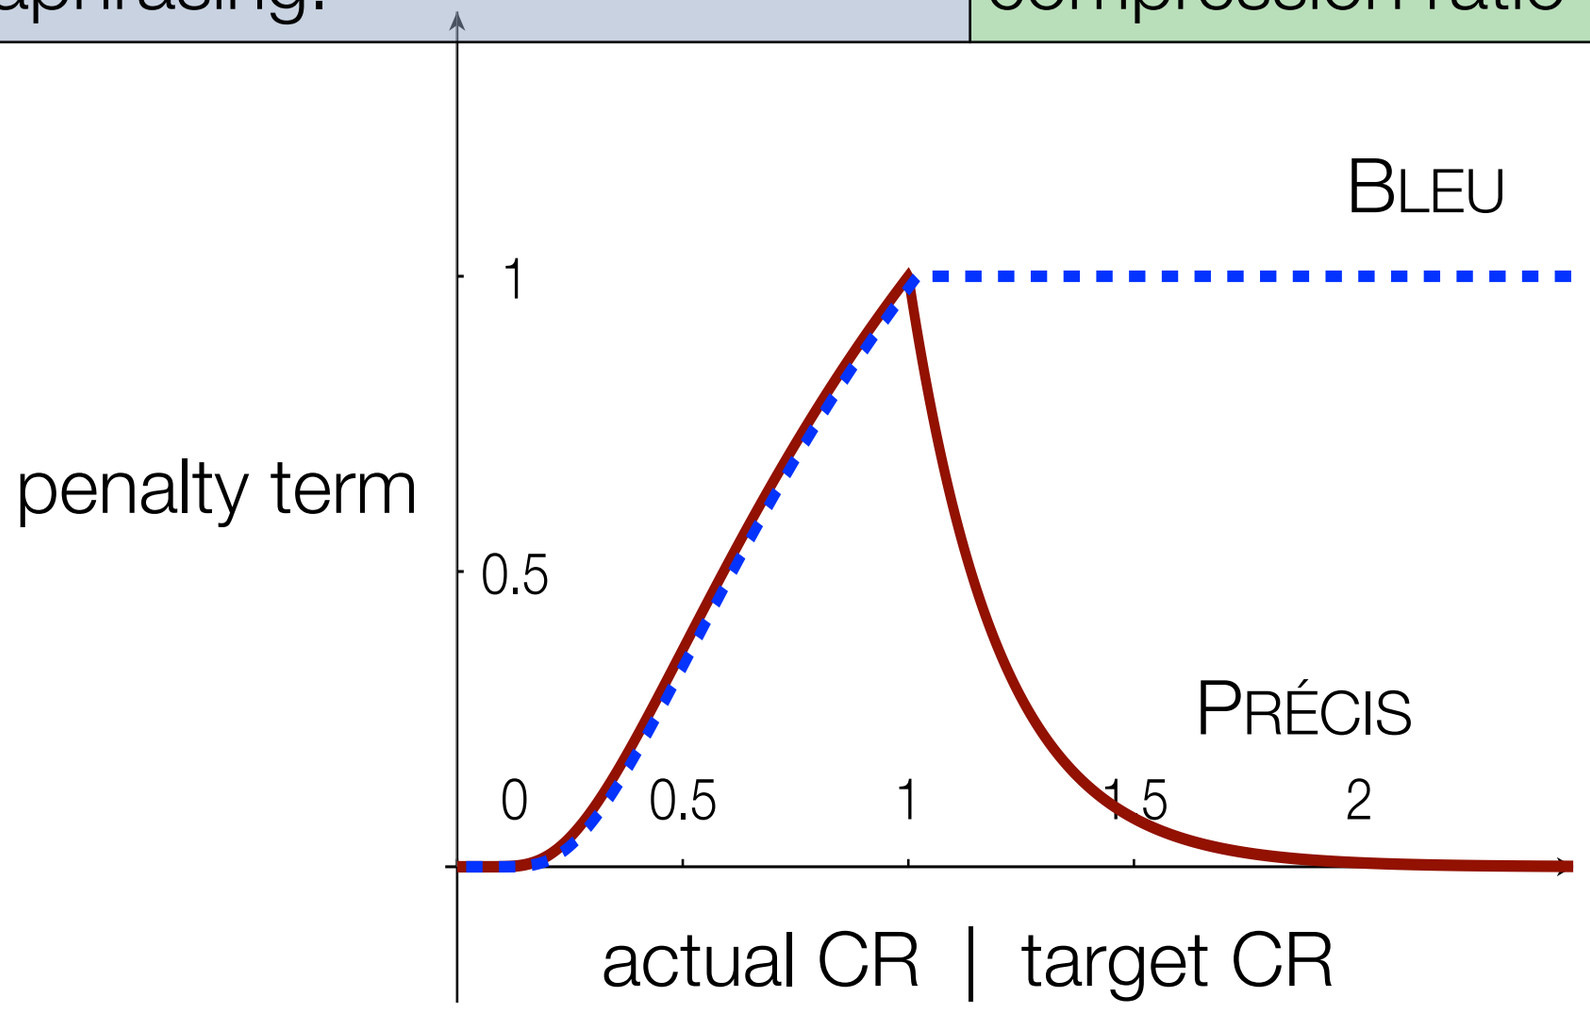
SMT	T2T
English reference translations that are used to calculate BLEU for SMT.	Selected pairs of reference translations that significantly differ in length.

and he said that the project **will cover** the needs of the region **in the long term.**	82
he said the project **includes** all the district's **long-term** needs.	65

compression ratio = 0.79

Objective Function

SMT	T2T
Optimized for English-to-English BLEU score. Causes self-paraphrasing.	Add a “verbosity penalty” to BLEU that allows a target compression ratio to be set.



Features

SMT	T2T
Phrasal and lexical probabilities quantify general paraphrase quality.	Features counting number of source and target words and the difference between them.

$$\text{VP} \rightarrow \text{NP was eaten by NN} \quad | \quad \text{NN ate NP}$$

$$p(e_1|e_2) = 0.1$$

$$c_{e_1} = 14$$
$$c_{e_2} = 5$$
$$c_{diff} = -9$$

$$logCR = \log \frac{c_{e_1}}{c_{e_2}}$$

Augmentations

SMT	T2T
It is not typical for additional task-specific rules to be added in the standard SMT pipeline.	Augment the grammar with deletion rules for specific POS (JJ, RB, DT) allowing for shorter compressions.

$$JJ \rightarrow \text{superfluous} \mid \varepsilon$$

$$RB \rightarrow \text{redundantly} \mid \varepsilon$$

$$DT \rightarrow \text{the} \mid \varepsilon$$

Monolingually-derived Features

SMT	T2T
All features, aside from the LM, are bilingually derived.	Calculate distributional similarity of paraphrase pairs from monolingual data

Orthogonal signal to bilingual pivoting

Even more data available

Incorporated as features in T2T model

Distributional Similarity

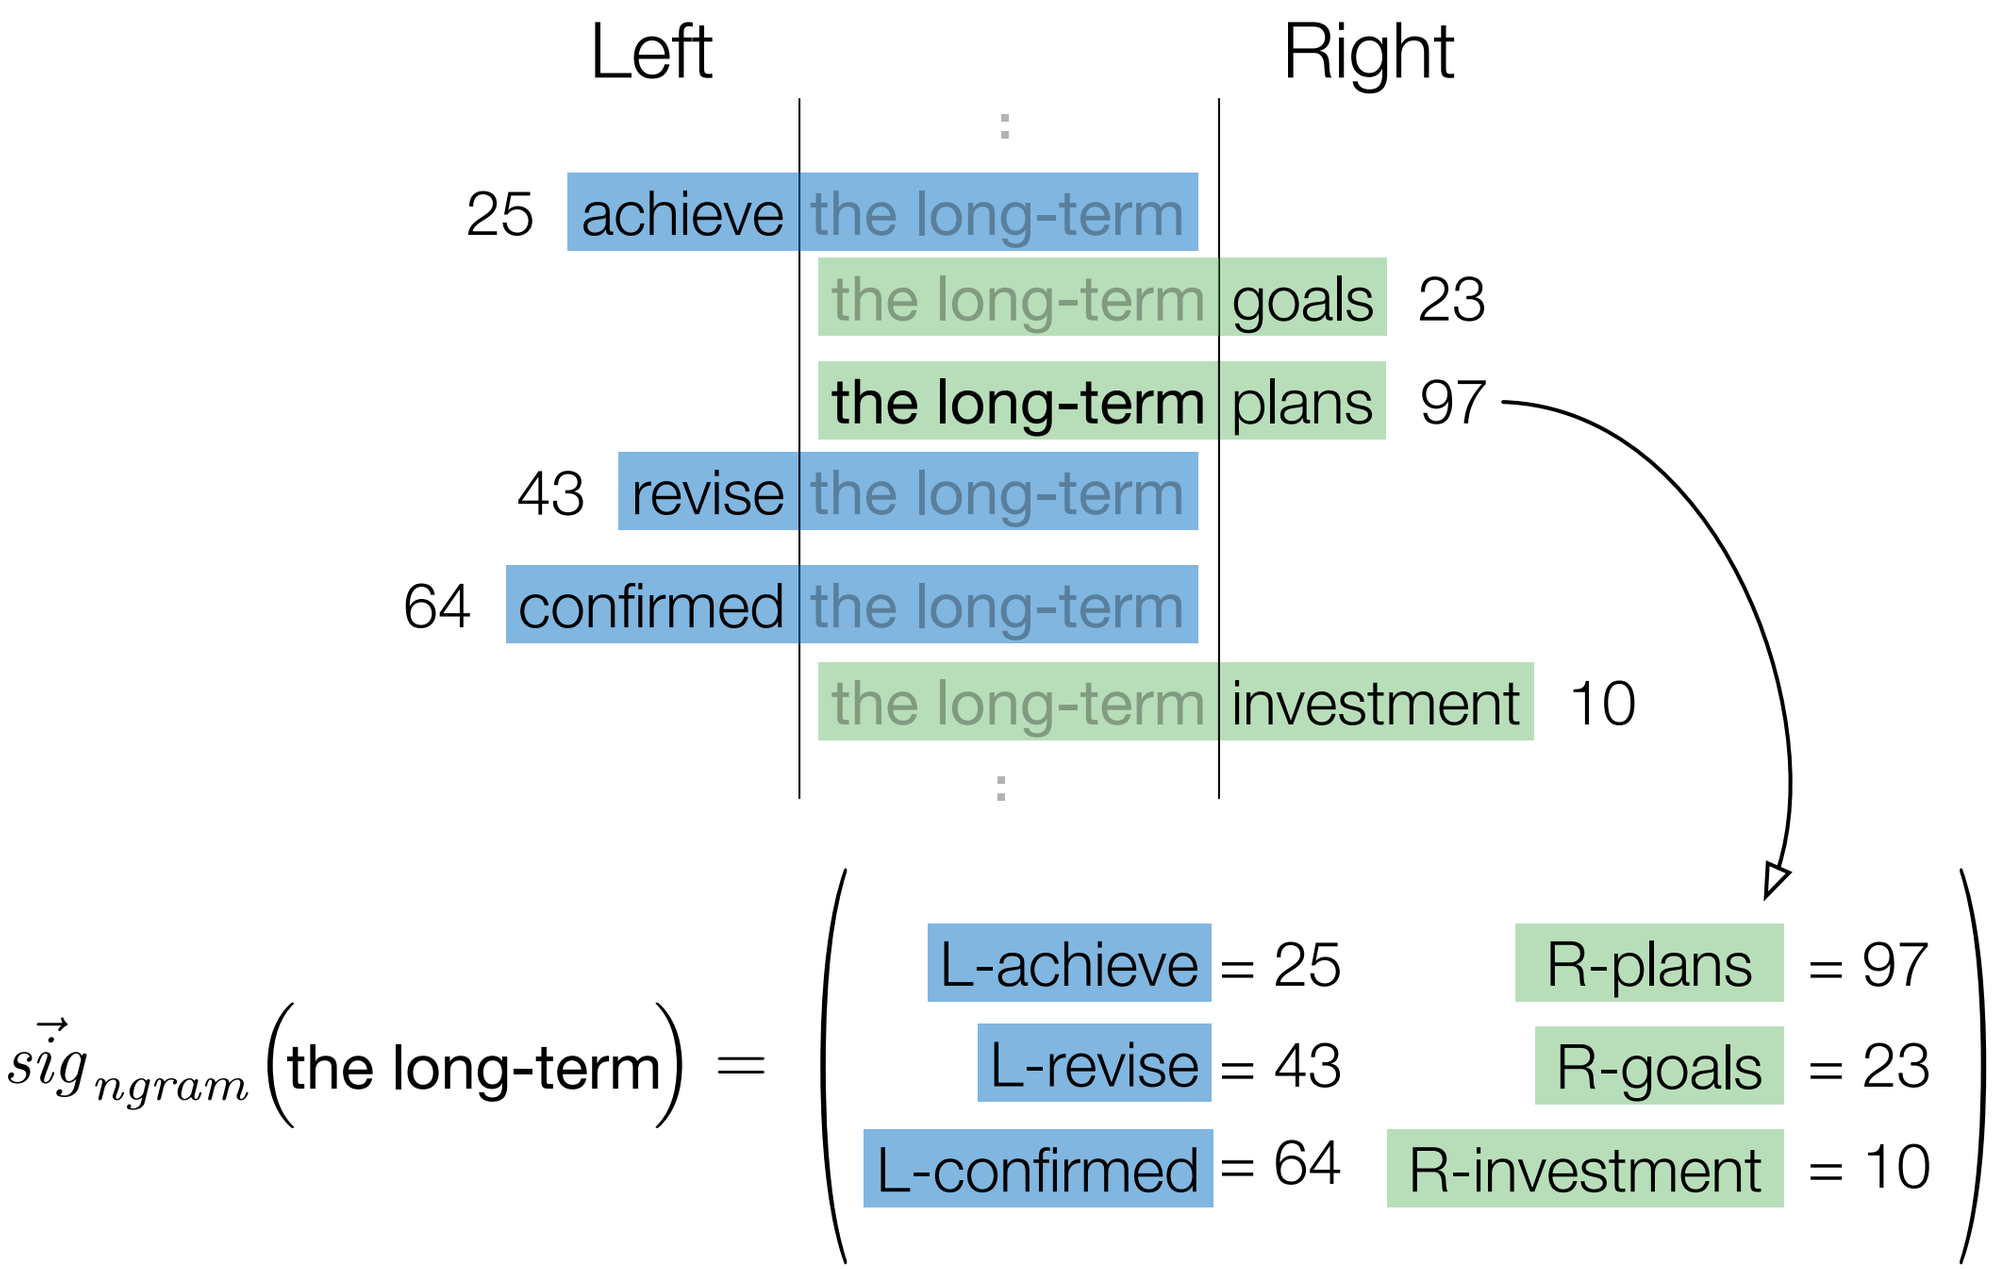
Idea: similar words occur in similar contexts.

Characterize words by their contexts

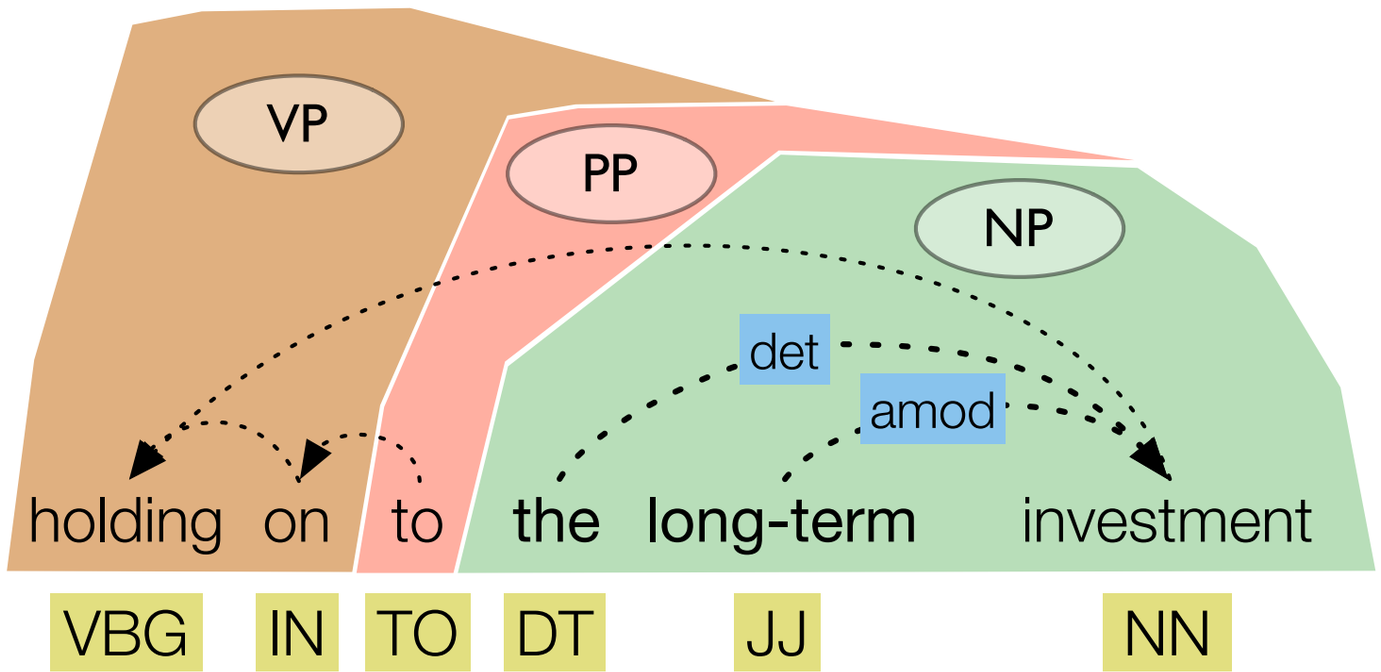
Contexts represented by co-occurrence vectors, similarity quantified by cosine

"Are these paraphrases substitutable?"

n-gram Context



Syntactic Context



$$\vec{sig}_{syntax}\left(\text{the long-term}\right) = \left(\begin{array}{ll} \text{lex-R-investment} & \text{lex-L-on-to} \\ \text{pos-L-IN-TO} & \text{pos-L-TO} \quad \text{lex-L-to} \\ \text{dep-det-R-investment} & \text{pos-R-NN} \\ \text{dep-amod-R-investment} & \\ \text{dep-det-R-NN} & \text{dep-amod-R-NN} \\ \text{syn-gov-NP} & \text{syn-miss-L-NN} \end{array} \right)$$

Large Monolingual Data Sets

Google n-grams

Collection of 1 trillion tokens with counts

Based on vast amounts of text

Annotated Gigaword (AKBC-WEKEX ’12)

Collection of 4 billion words, parsed and tagged

Monolingual Distributional Similarity for Text-to-Text Generation. Juri Ganitkevitch, Ben Van Durme and Chris Callison-Burch. StarSEM 2012.

Task-based Evaluation

Evaluated paraphrases in the context of a T2T compression task.

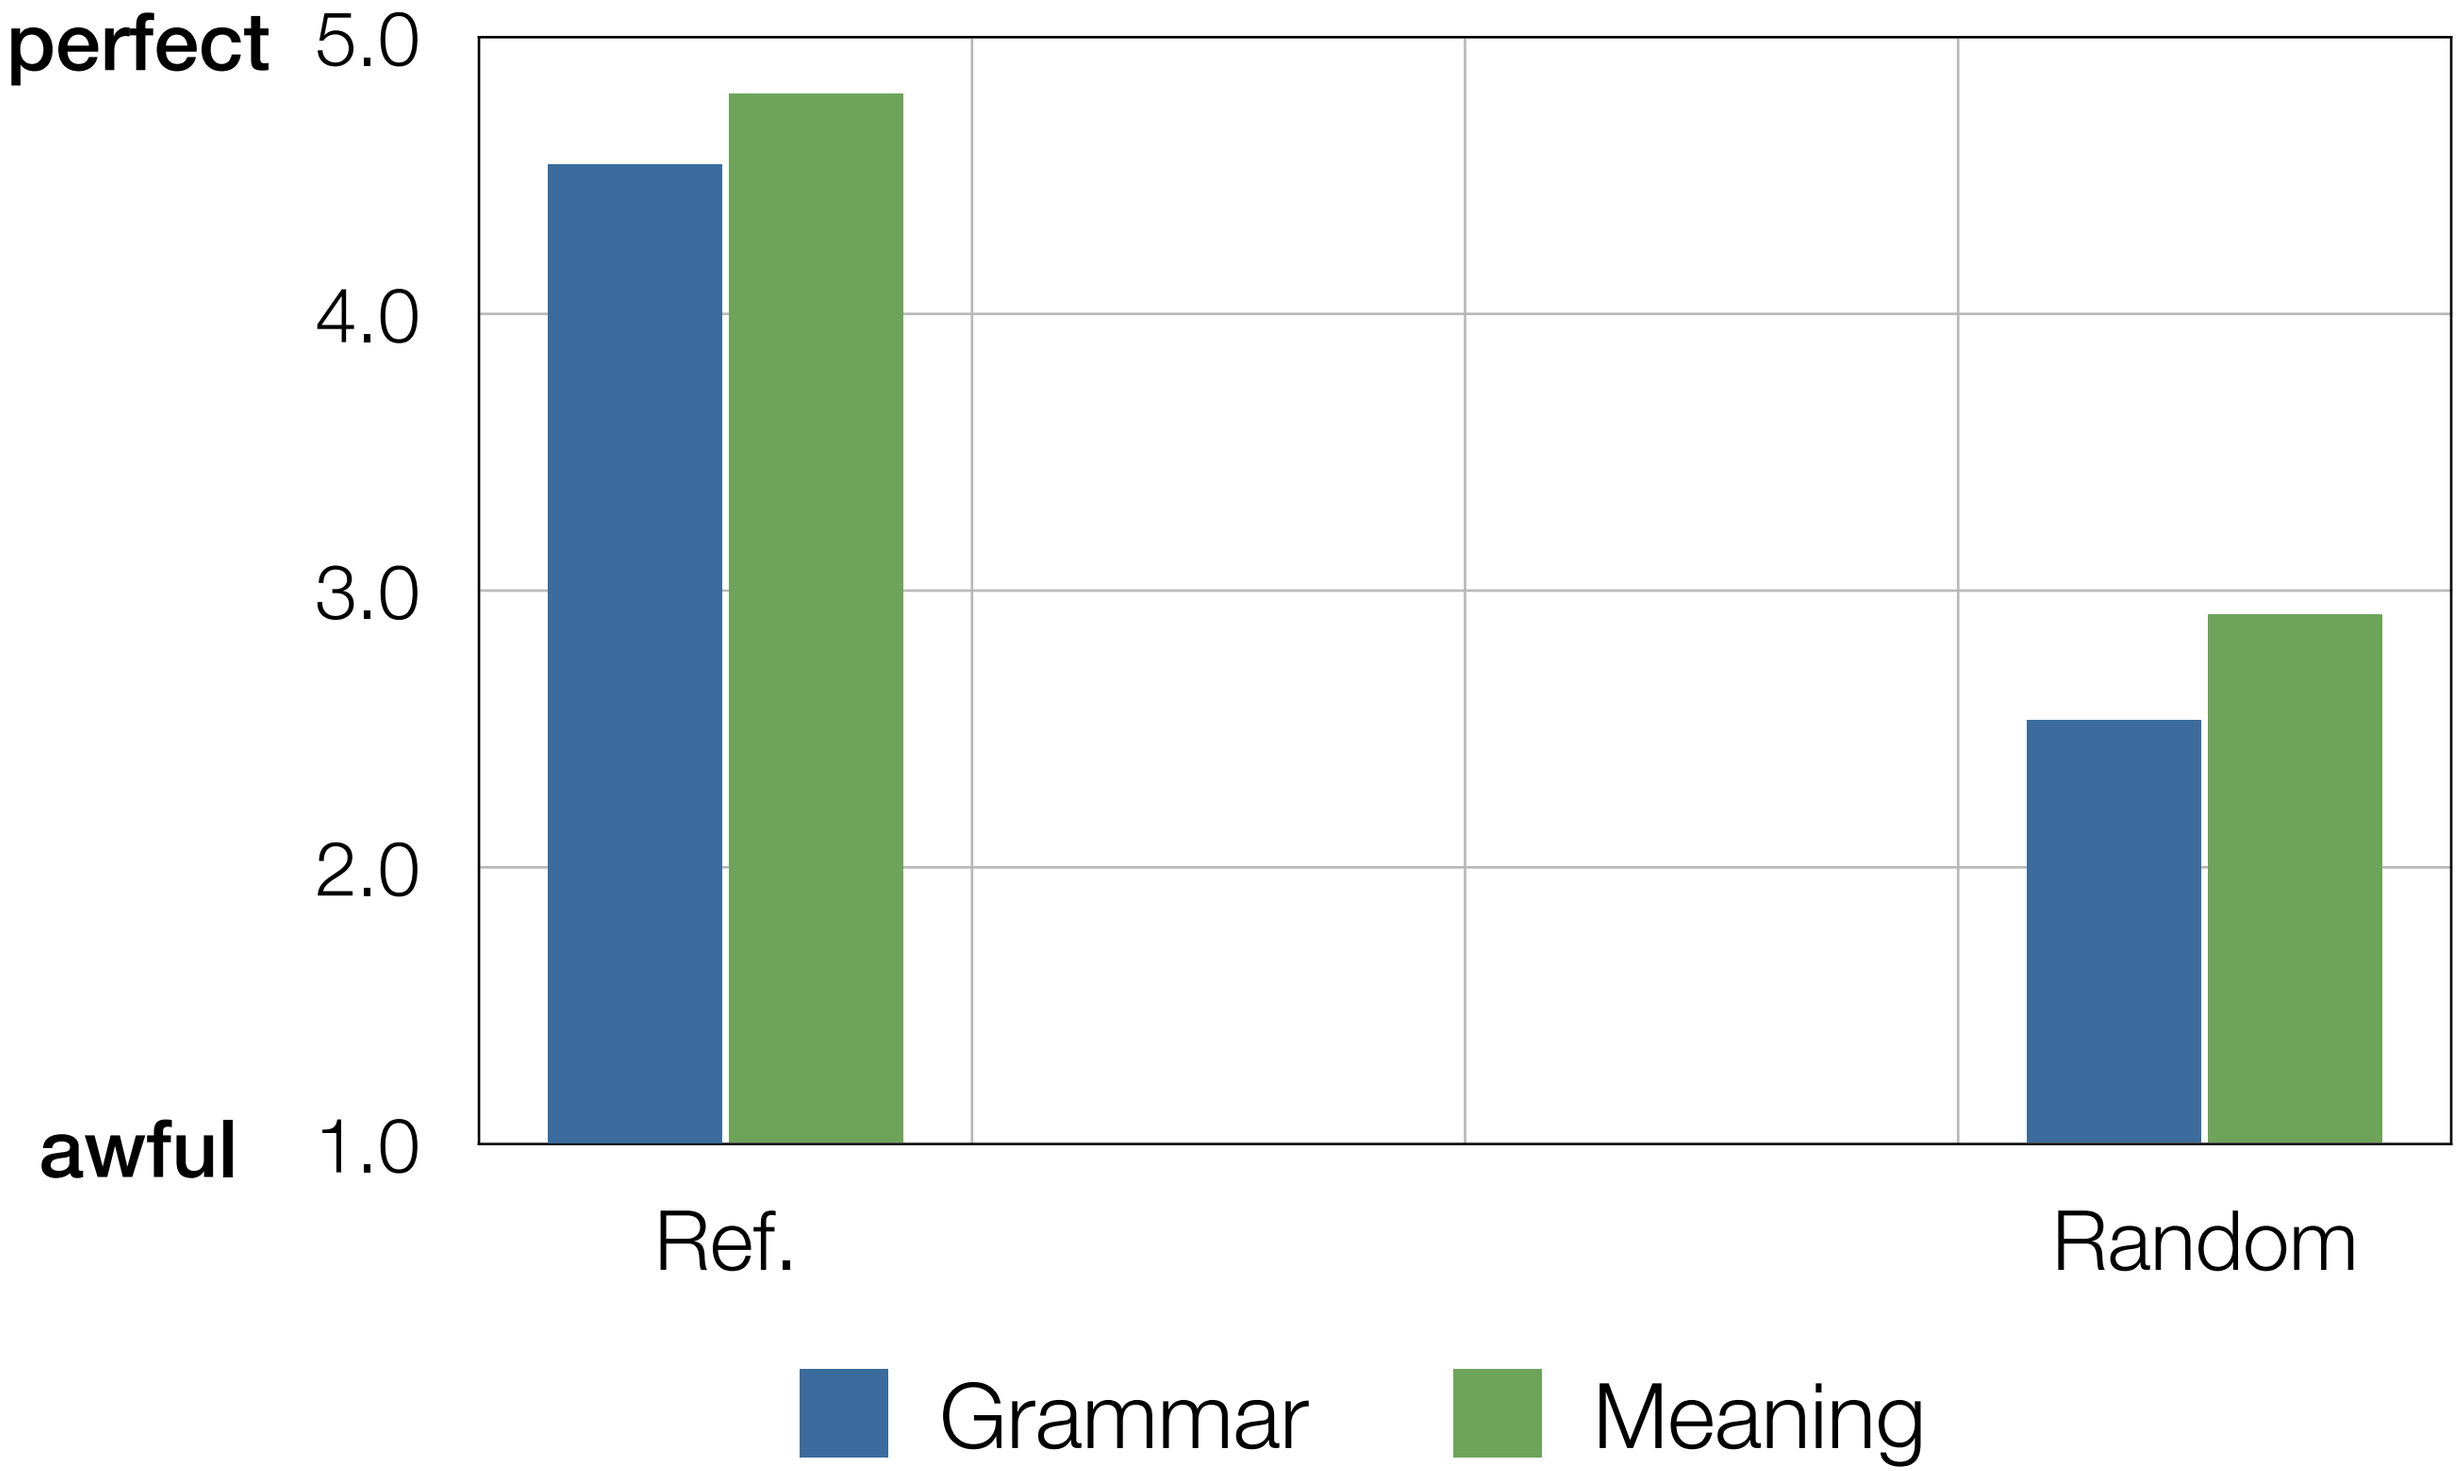
Compared against a state of the art system.

Human assessment (5-point scale):

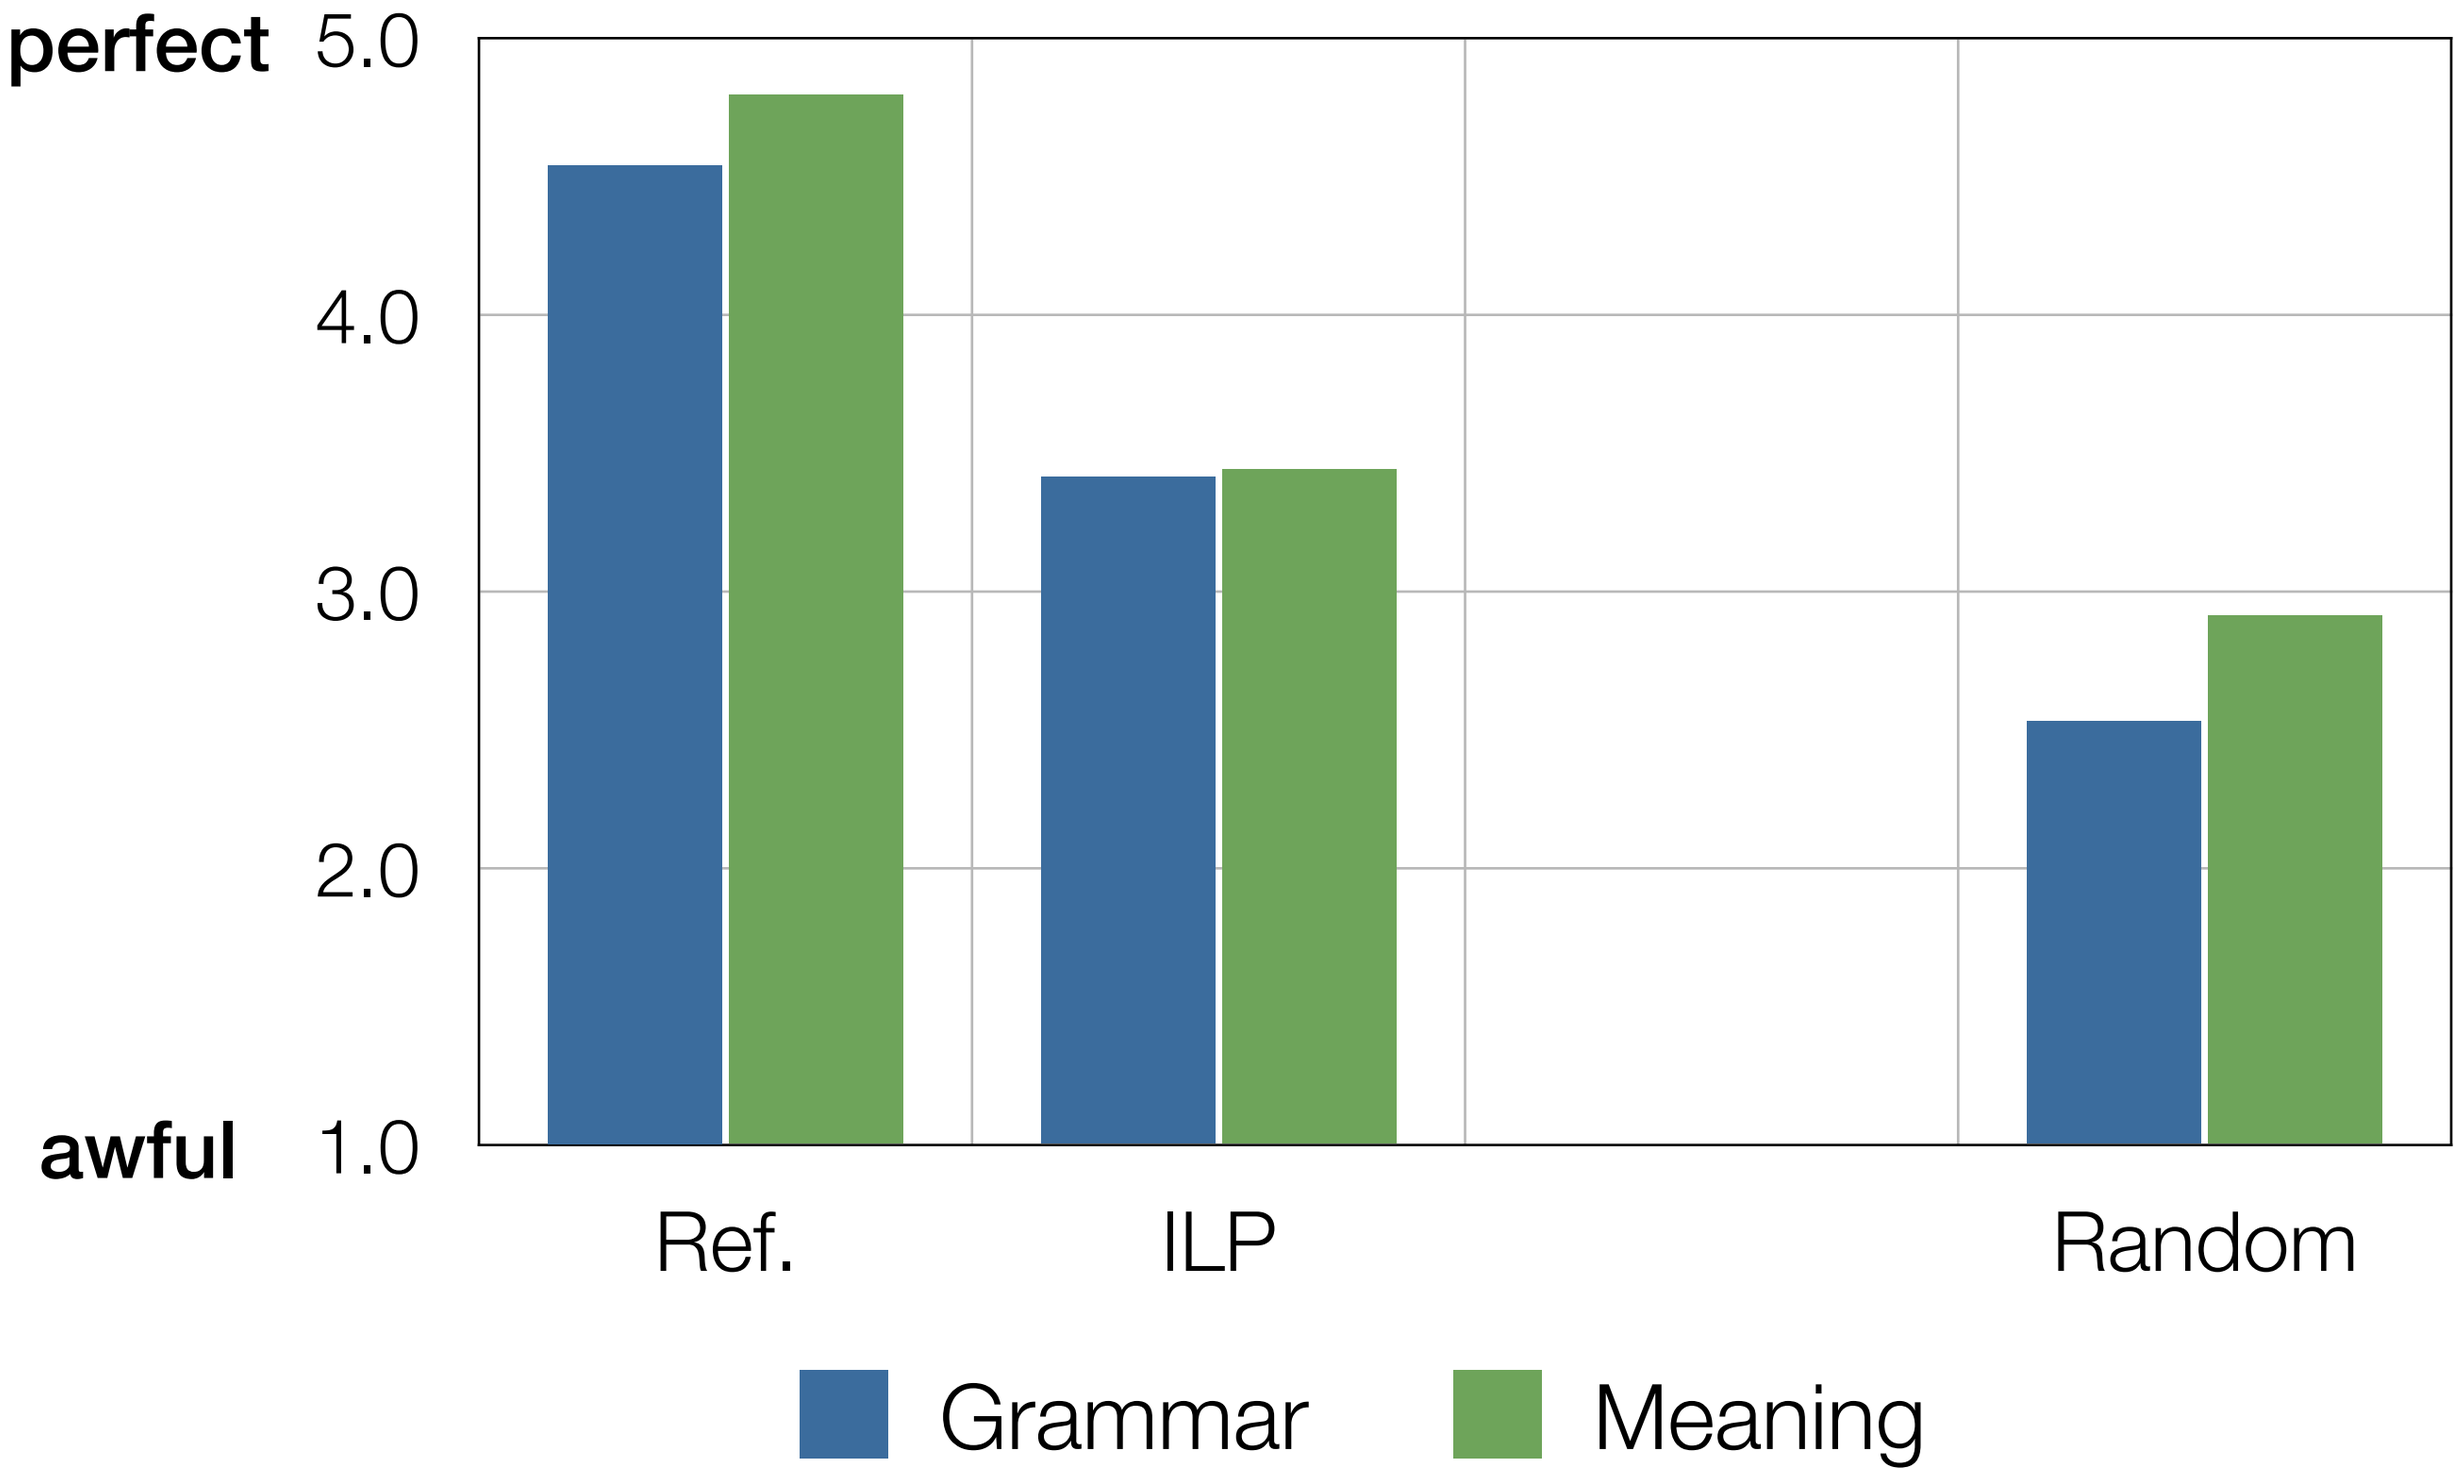
How well do these sentences retain the meaning of original?

How grammatical is the resulting sentence?

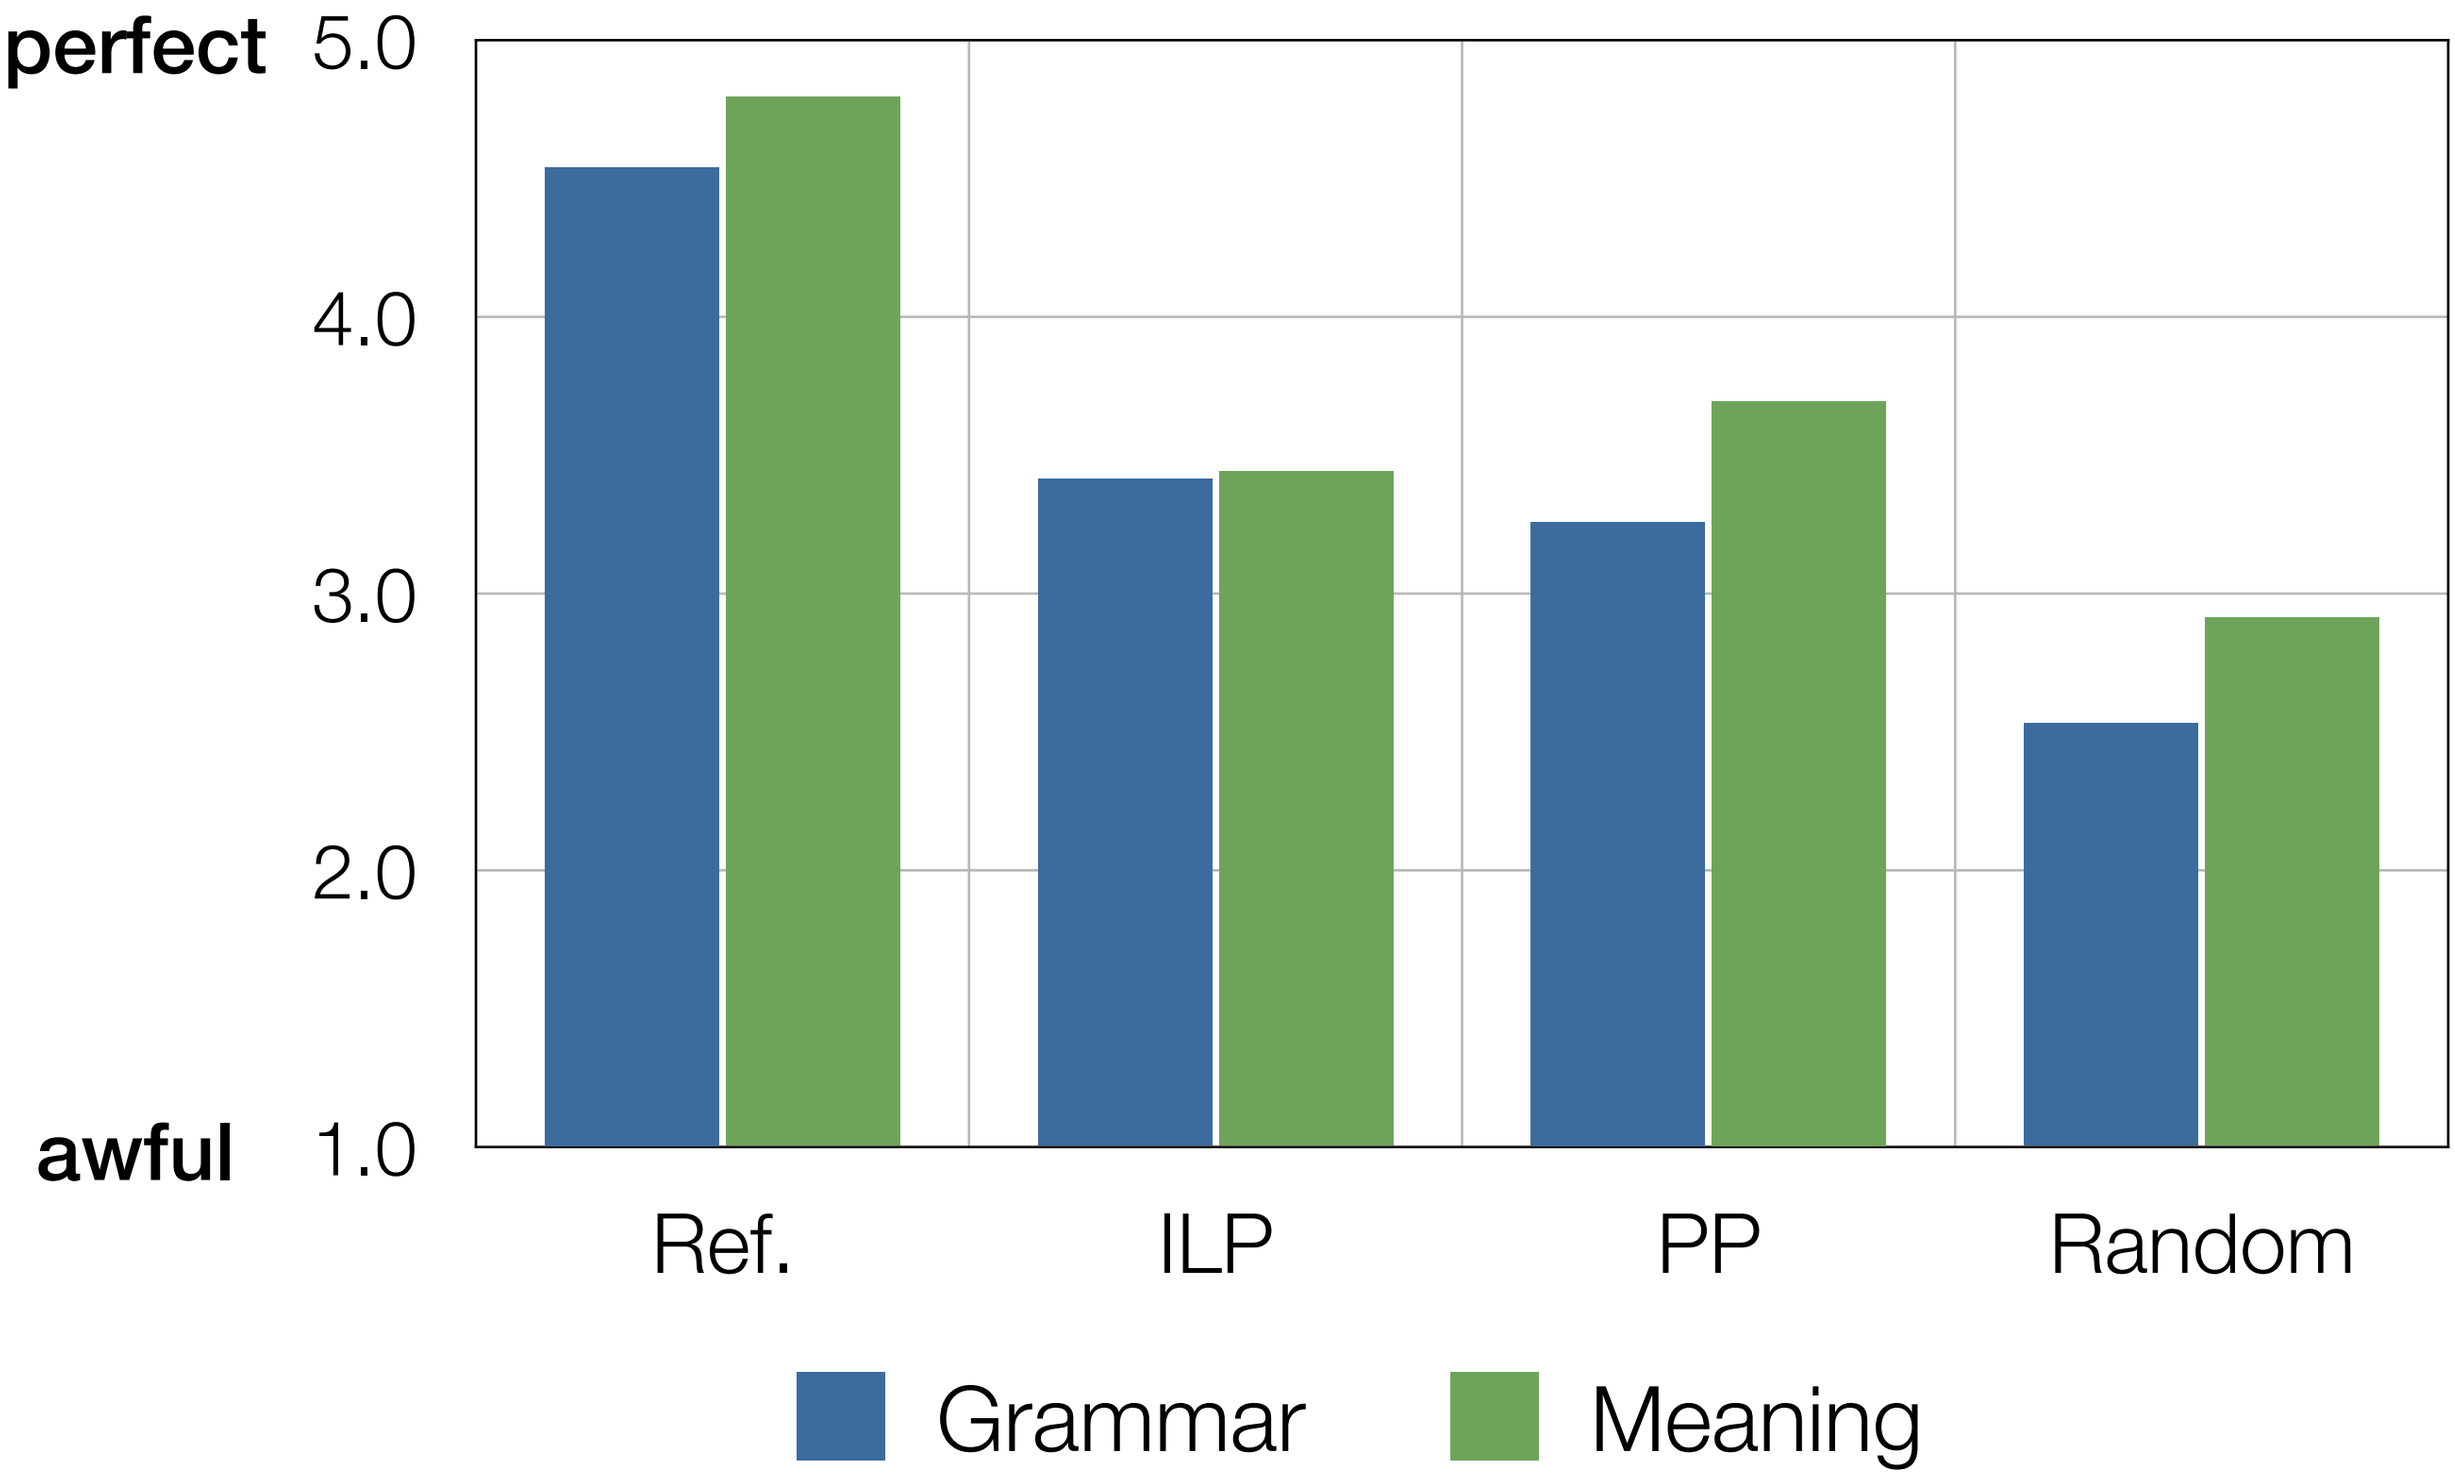
Compression Quality



Compression Quality

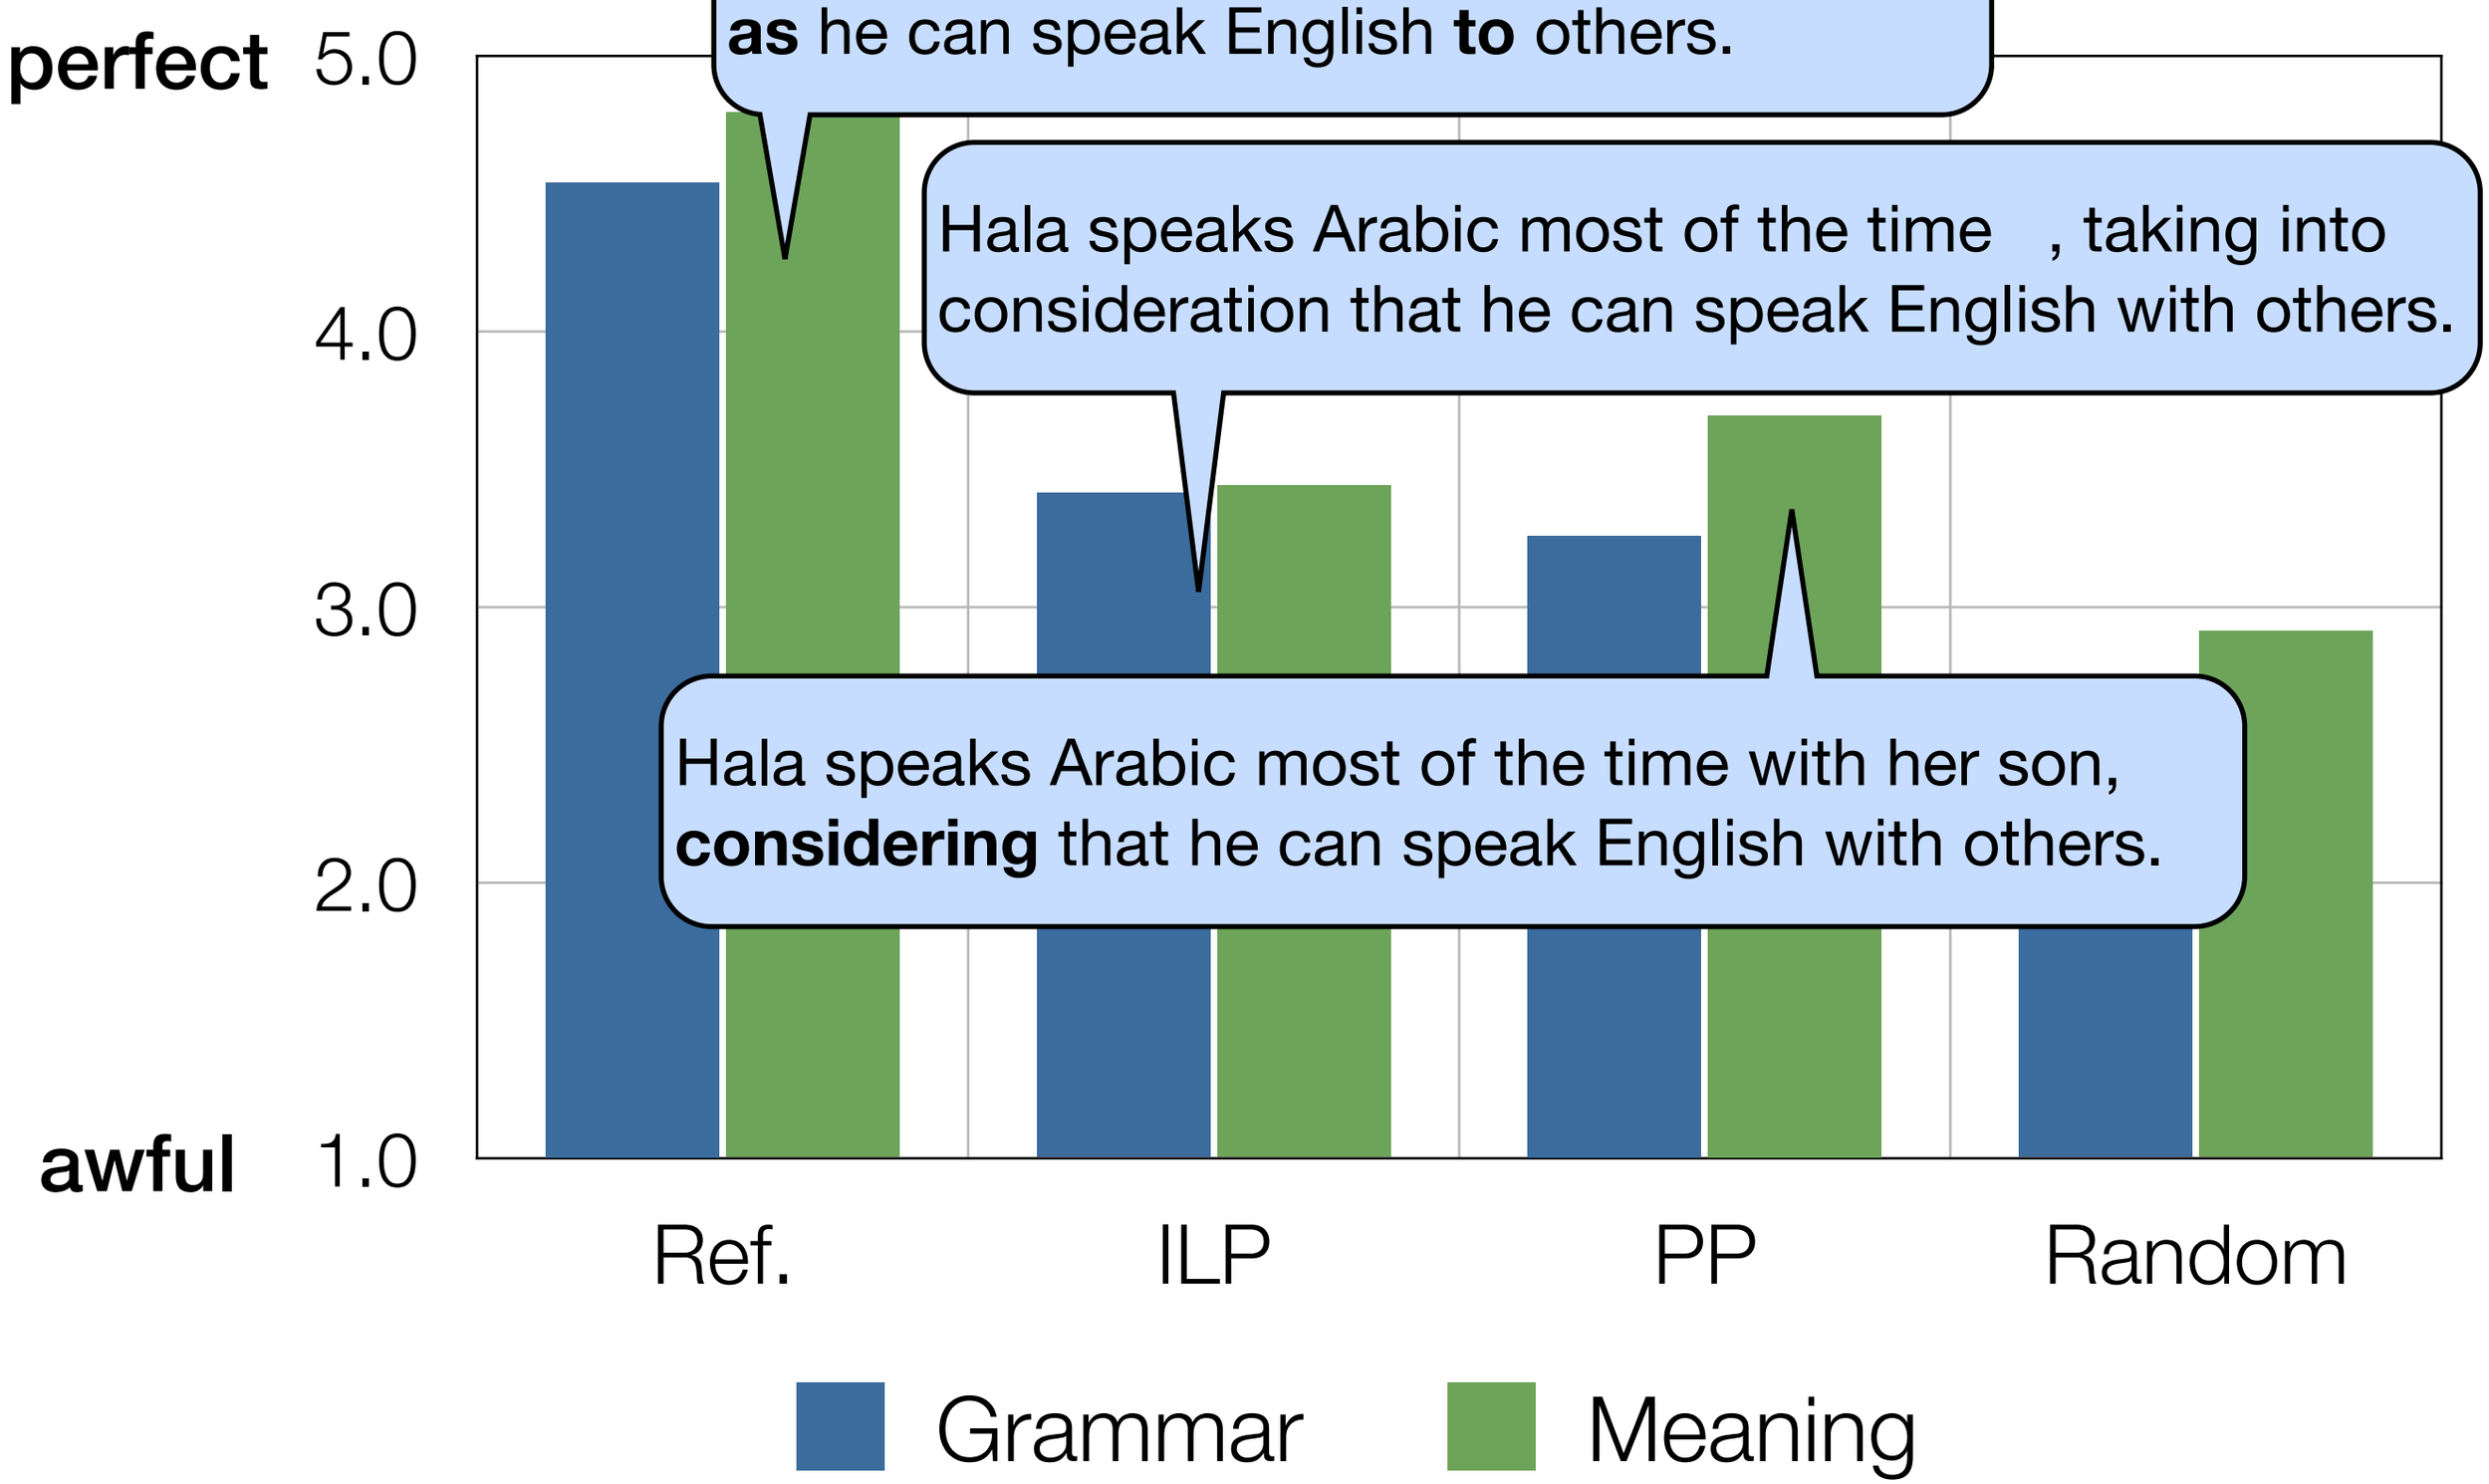


Compression Quality



Input: Hala speaks Arabic most of the time with her son, taking into consideration that he can speak English with others.

Comprehensibility



Hala speaks to her son **mostly in Arabic as** he can speak English **to** others.

Hala speaks Arabic most of the time , taking into consideration that he can speak English with others.

Hala speaks Arabic most of the time with her son, **considering** that he can speak English with others.

Adaptation in 5 easy steps

Step	SMT to T2T Adaptation
1	**Dev data:** Collect a set of sentence pairs that reflects the task that you are trying to model
2	**Objective function:** Create a new objective function that indicates how well the system output the constraints of your task
3	**Task-specific features:** Add new features to the model that will allow it to score its own output for the task
4	**Augment the grammar:** Use your domain knowledge to add any rules that would not normally be contained in a paraphrase grammar.
5	**Other features:** Take advantage of the English to English to add other features that model grammaticality more generally.

Summary

Extraction & Representation

Extended large-scale paraphrase acquisition from bitexts to syntactic paraphrases

Generation

Introduced a straightforward and effective adaptation framework

Extensions beyond SMT

Improved performance by using monolingual information

Current directions

Domain-specific paraphrasing

What if we want to generate paraphrases for specific domains like biology? Do they vary? How do we ensure ours are appropriate

Paraphrase recognition and entailment

The RTE problem diverges in interesting ways from paraphrasing. We are combining natural language inference and data-driven paraphrasing.

Divide

Parliament	**Biology**
gap	divided
division	division
